

# Watch this space

The first space utilisation and workstyle survey has been completed for the new **B3Hub for Allied Health**, and the profile shows that space for individual work, is important to the success of the new workspace.

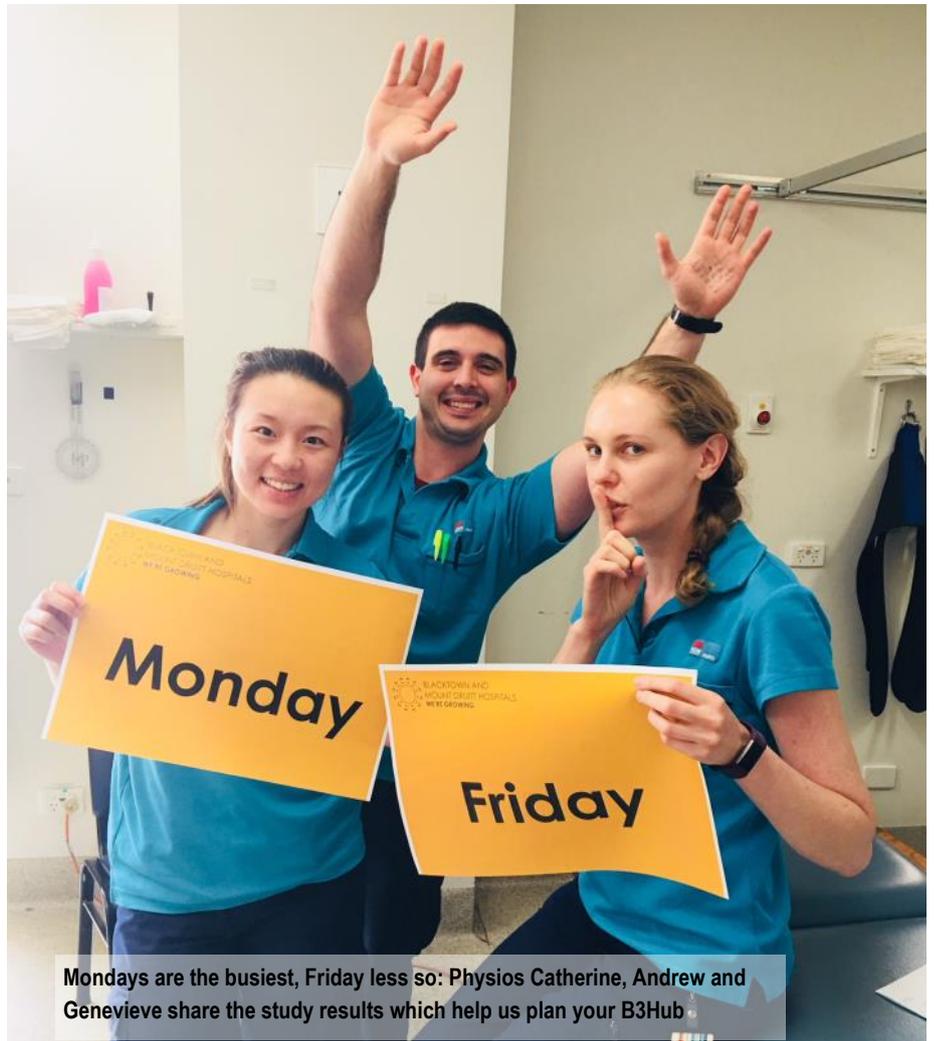

The space utilisation study tracked which spaces were occupied and when.

As well as showing a clear preference for individual workpoints, the study showed that overall workspaces were only occupied about 30% of the time.

"The survey is an important step in validating the design of the B3Hub," explained project officer Nathan Ferguson.

"As part of the transition to activity-based working, we know that work styles will change but the space study gives us a baseline for how we're working at the moment.

"It also allows us to confirm we have enough individual workpoints, meeting and collaborative spaces like chat booths," Nathan said.

Mondays are the busiest, Friday less so: Physios Catherine, Andrew and Genevieve share the study results which help us plan your B3Hub

"For Allied Health staff in particular, they spend more time in clinical areas providing patient care, so there is a lot of movement between the current office space, and the wards and clinics.

"We can see this clearly in the study data and we know that we have enough of the right kind of workspace to provide a flexible environment for the way they need to work."

Up to **80%** of work at any time was being done in an individual workspace

About **30%** of workpoints were occupied at any given time

Individual workpoints were the most popular, in use about **59%** of the time

**Monday** is the busiest day and **Friday** is the quietest
